

## IN THE SPECIFICATION

Please replace the paragraphs as indicated by the following to conform to the claim language and without introducing new matter:

Paragraph [003] on page 2.

A first separate aspect of the present invention includes the support having a guide ~~surface~~ and the bracket having a ~~guide~~ follower cooperating with the guide ~~surface~~ to restrain the bracket from moving rotationally about the rod.

Paragraph [019] on page 5.

Assembled, the edge of the mounting section 50 provides a ~~guide~~ follower 66 which approaches a guide ~~surface~~ 68 defined by the ~~front~~ surface of the body 28 facing the rod 60. The ~~guide~~ follower 66 and guide ~~surface~~ 68 provide indexing for the bracket 46 relative to the base 26. The mount may hold the sprinkler head 18 under lateral force to keep the sprinkler head 18 and the cover plate 24 aligned properly with the ceiling. The bracket 46 provides displacement parallel to the alignment of the support holes 42 and 44 from its mounting section 50 to the retaining section 54 through the vertical displacement section 52. This allows for adequate adjustment and yet the base 26 remains displaced from the ceiling 12. At the same time the rod 60 remains laterally adjacent the sprinkler head 18 for vertical adjustment through the hole in the ceiling 12.
